Requirement Analysis
Customer Journey map

Date	5 march 2026
Team ID	Anushka Madihali, Anuja Chavan, Pranav Sutar,Shrivardhan Patil
Project Name	Heart disease analysis

Phase	Experience Steps	Interactions	Goals & Motivations	Positive Moments	Negative Moments	Areas of Opportunity
Entice	Learns about heart disease risks from social media, health blogs, and doctor visits	Health ads, awareness campaigns, hospital posters, YouTube videos	Understand what factors contribute to heart disease and how to prevent it	Curiosity sparked by online heart health statistics and risk calculators	Gets overwhelmed by too much medical jargon and unstructured data	Provide a clean, single Tableau dashboard entry point showing key risk factors
Enter	Searches for heart disease risk factors, BMI ranges, smoking impact, and diabetes connection	Browses health websites, hospital portals, Tableau Public dashboards	Wants to identify personal and population-level risk factors by age, gender, and lifestyle	Finds some useful charts comparing smoking and heart disease	Difficult to compare multiple risk factors like BMI, age, and smoking simultaneously	Enable filters by age, gender, BMI, lifestyle habits, and existing conditions
Engage	Opens Tableau dashboard, filters by gender/age/race, explores visualizations	Uses Tableau dashboard, clicks on filters, compares stacked bars and bubble charts	Make confident observations based on visual insights from 4,500 patient records	Sees high-risk age groups and gender patterns clearly through interactive charts	Some visualizations like the treemap are too complex for non-technical users	Improve visual hierarchy, add brief tooltips explaining medical terms
Exit	Narrows down key risk factors contributing most to heart disease in the dataset	key risk factors contributing most to heart disease in the datasetFinal chart comparisons, dashboard story review, exports insights	Final confirmation of findings and actionable health recommendations	Validated insights through gender, age, BMI, smoking, and diabetes correlations	Still unsure about predictive risk scoring or individual-level recommendations	Add summary cards showing top 3 risk factors and recommended preventive actions

Extend	After analysis, shares findings with peers, policymakers, or healthcare providers	Shares Tableau Public link, presents dashboard, returns for updated analysis	Wants to justify findings and contribute to better health policy and awareness	Proud of data-driven insights that can support real preventive healthcare decisions	Might feel uncertain about data freshness or generalizability to other populations	Add data refresh options and expandable dataset support for future analysis
